# LocP⊙int® Marine Web

LocPoint Marine can be used with any available web browser, which gives maximum flexibility in connection with location and workplace arrangements.

The system, which operates on the Unix platform, has an advanced group division of units and users. This makes it possible to define users' limits in their access to certain groups of units. Consequently, customers and cooperators can be admitted to use the system or sections of it.

LocPoint Marine positions and communicates mainly via Inmarsat. The administrator or authorized users configure their own planning of positioning, alarms and reports to be distributed. The various waypoint groups are administered according to the rights of the users.

LocPoint Marine handles various types of alarms - among them alarms from SSAS (Ship Security Alert System). The administrator can direct the alarms to one or more recipients according to the nature of the alarm, actual conditions and where in the world the ship may be operating. This makes the system an extremely powerful tool in various areas as f.i.:

- Commercial shipping
- Port- and harbour operations
- Survey and maintenance of waterways
- Environmental services
- Government- and maritime authorities
- Maritime security

LocPoint Marine can, f.i. in connection with port- and harbour operations, survey and maintenance, operate maritime- as well as landmobile units within the same application. This can be done irrespective of the method of communication - Inmarsat, GSM or other communication methods can be used.

The system offers a total view and optimum reliability and security.
